TITLE: Artificial skating rink in the Sports Palace in Moscow.
(Iskusstvennyy katok vo Dvortse Sporta v Moskve).

PERIODICAL: "Kholodil'naya Tekhnika" (Refrigeration Engineering),
1957, No.1, pp. 31-34 (U.S.S.R.)

ABSTRACT: There are four artificial skating rinks at present in Moscow and the building of a fifth is scheduled in Izmaylovo. Moscow experience has proved that for all the year round sports training it is preferable to have closed skating rinks which are not dependent on the meteorological conditions and in which the surface of the ice is not contaminated by dust, dirt etc. from the outside. Also, closed skating rinks can be fitted with improved ventilation or air conditioning to improve the comfort of the spectators. Furthermore, the same space can also be utilised for other activities such as concerts etc. In November, 1956 a large closed skating rink with a field area of 61 x 30 m was put into operation in the Central Stadium imeni V.I. Lenin in the building of the Sports Palace. The building, which contains a skating rink, can accommodate 15 000 spectators, see Fig.1. In this article a brief description is given of the design of the ice field, mentioning also the main data

Card 1/3 of the refrigeration equipment. The cooling liquid is fed

Artificial skating rink in the Sports Palace in Moscow.
(Cont.)

through a system of 45 mm dia. pipes spaced at 100 mm interaxial distance. Altogether 300 pipes of a total length of 19 000 m have been laid and Fig.3 shows a photograph taken during their installation. The engine room is located at about 200 m from the Sports Palace, it contains four vertical 2-cylinder compressors type 2 AB-27, each of a cooling capacity of 425 000 N kcal/hr at 480 r.p.m. driven by a 155 kW motor. There are two jacket-tube evaporators each with a surface of 200 m², two jacket-tube horizontal condensers each with a surface of 150 m², two 3.5 m³ receiver vessels, a cooler of 24 m² surface, three salt mixture pumps of a feed rate of 340 m³/hr, two oil separators with gas washing, oil collectors and auxiliary equipment. The salt-water system is filled with 150 m³ of 26% aqueous solution of calcium chloride, the rated boiling temperature of the ammonia is -21 C, the average temperature of the salt solution is -16 C. The buildings of the Sports Palace are heated from the Urban District Heating Station and during the hockey tournament in the winter the temperature in the hall can be maintained at 18 to 20 C. The installation of the

Card 2/3

Artificial skating rink in the Sports Palace in Moscow.
(Cont.)

66-1-10/26

cooling equipment and of the pipe system is effected by industrial methods; the tube joints (over 4000 of them) were effected by electric butt welding. Four days after the refrigeration machinery was put into operation a uniform ice field of a thickness of 4 cm was produced, the quality of which was highly appreciated by the sportsmen. There are three figures.

PHASE I BOOK EXPLOITATION SOV/3747

International Congress of Refrigeration. Moscow, 1958

Sbornik dokladov ot SSSR (Collected Soviet Reports) Moscow, Gostorgizdat, 1959. 214 p. Errata slip inserted. 2,000 copies printed.

Ed. (Title page): Sh. N. Kobulashvili; Ed. (Inside book): N. V. Chichkov;
Tech. Ed.: V. V. Babicheva.

PURPOSE: This collection of articles is intended for those interested in the problems of food refrigeration.

COVERAGE: The collection contains 26 reports which were submitted at the meeting of the 3rd, 4th, and 5th Committees of the International Institute of Refrigeration. The meeting was held in Moscow, September 3-6, 1958, and was attended by 265 Soviet specialists and 115 representatives from other countries. The 73 reports discussed at this meeting cover such broad areas as the automation of the cooling of refrigerating installations, the use of finned-tube type refrigerating devices, fast-freezing food freezers, the

theory and technique of rapid cooling and freezing of meat and fish, the use of antibiotics in the cold storage of food, and the operation of refrigerators and cooling systems. A complete account of the proceedings of this meeting was published by the International Institute of Refrigeration in 1959. No personalities are mentioned. References follow several of the articles.

TITLE: Smooth ceilings necessary in refrigeration chambers

SOURCE: Kholodil'naya tekhnika, no. 5, 1964, 14-18

TOPIC TAGS: refrigeration engineering, structural engineering

ABSTRACT: This article is a survey of recent Soviet and foreign experience in connection with the near-universal beam-type reinforced-concrete construction employed in refrigeration installations. There is no doubt that the presence of exposed ceiling beams seriously violates one of the necessary conditions of efficient refrigeration -- normal air circulation and uniform relative humidity. The author describes a number of Soviet tests supporting this conclusion. A return to earlier beamless design is strongly recommended, though this runs counter to current Soviet construction and design practice. There is one Soviet "smooth-ceiling" refrigeration plant in existence (a 16,000-ton multistory plant in Moscow-

Card 1/2

TITLE: Foreign Layouts of Principal Equipment and Powerhouses of Hydroelectric Stations

PERIODICAL: V sb.: Energ. str-vo. Z. M.-L., 1958, pp 43-55

ABSTRACT: During recent years, a trend has appeared abroad toward simplifying the layouts of principal equipment and powerhouses of hydroelectric stations; the hydroelectric units at river-type stations are so designed that certain assemblies of the turbine are made integral with the generator. This ensures a lighter and more compact construction of the unit and results in a reduced amount of construction work. The new layouts are studied on large-scale models and in actual construction: all hydraulic, strength, mechanical, vibrational, cavitation, and other phenomena encountered in the unit and in auxiliary structures are investigated. New units have been constructed that

Card 1/2

SOV/112-59-5-8705

Foreign Layouts of Principal Equipment and Powerhouses of Hydroelectric Stations
withstand or are proof against runaway conditions, which permits saving on
some gates. Outdoor and semi-outdoor hydroelectric stations have come into
wide usage even under severe climatic conditions. The new layouts save cost
and time of constructing the hydroelectric stations.

TITLE: Magnitude of water and heat flow through the Drake Passage

SOURCE: Sovetskaya antarkticheskaya ekspeditsiya, 1955-. Informationnyy byulleten', no. 54, 1965, 33-39

TOPIC TAGS: ocean dynamics, temperature gradient, heat balance, temperature measurement

ABSTRACT: This paper attempts to settle the controversial question of the heat and water balance in the Drake Passage. The authors used data from 85 hydrological stations located along the Passage. To average the data obtained at different stations under different meteorologic conditions and in different years, they subdivided the Passage into rectangles containing approximately the same number of stations. The readings of temperature and salinity were then averaged for each rectangle. While there is no satisfactory method for selecting the zero-surface, perhaps the most acceptable of those is that of A. Defant, which is based on the comparison of differences of dynamic depths. The authors used this method and checked the results by the method of

Cord 1/2

L 06415-67

ACC NR: AT6025296

O. I. Mamayev. The investigations indicate that the depth of the zero-surface is controlled by the vertical stratification of water. The greater the vertical gradient of density, the closer is the zero-surface to the surface. Conversely, the more homogeneous the water is, the deeper is the zero-surface. The stability of the density strata in the sea is influenced by temperature changes. In summer, for example, the maximum stability gradient is observed in 2000-2400 m and 200-500 m. In winter, the maximum rises to 1000-1500 m at the station (rectangle) I and to 1300-1600 m at the station (rectangle) VIII. In other words, the zero-surface in the Drake Passage rises from the center to both south and north. It is higher in the south in summer and in the north in winter. In the central portion of the Passage, where the bulk of water comes from the Eastern Circumpolar current, the zero-surface remains at 4000 m depth the year round. Obviously, this flow is not a surface current but occurs at lower depths. The axis of this flow lies between 58° S and 59° S. Velocity may reach 22 cm/sec. In the north, the water velocity averages 17 cm/sec in summer and 7 cm/sec in the winter. In the south, summer velocities are 3.0 cm/sec and the winter velocities are about 5.5 cm/sec. The water flows from west to east; transfer in the opposite direction is slight. The volume of water going through the Passage in summer is about 30% greater than in winter. The heat balance is proportional to the balance of water. The temperature remains fairly constant through the year, being +2.28°C in summer and +2.02°C in winter. The authors conclude that the Defant method appears to be the best in existence. Orig. art. has: 3 figures, 1 table.

Computation of the Harmonic Constants of the Half-Daily Tidal Wave M_2
From the Monthly Cycle of Four Observations on the Fluctuations in the
Sea Level

Using four-term observations on the fluctuations in sea level, the author recomputed the moments of observation from ordinary solar time to the hour of wave M_2 . The observations are entered in a table having 24 graphs, each of which corresponds to one hour of the day of wave M_2 . Finding the mean value of the height of the level for each hour of wave M_2 , the author conducts the further computation according to the usual method. He notes the satisfactory agreement of the results of computation with the computations according to hourly observations. (RZhGeol, No. 4, 1955) Uch. zap. TITLE: The Great Eastern Drift in the Southern Ocean

SOURCE: Leningrad. Arkticheskiy i antarkticheskiy nauchno-issledovatel'skiy institut. Problemy Arktiki i Antarktiki, no. 22, 1966, 18-34

TOPIC TAGS: ocean current, ocean dynamics, ocean tide, oceanography, oceanographic expedition

ABSTRACT: An attempt is made to generalize the rather extensive mass of materials covering all basic observations on the eastern drift made in the Southern Ocean between 1901 and 1960. The "average station," and the dynamic method with respect to the "zero surface," calculated for the Southern Ocean by A. Defant, was used to process the results of the observations. Charts and tables are presented. The end result is the important, but not unexpected, conclusion that the Great Eastern Drift causes a flow of Atlantic waters into the Pacific, and that one can assume the existence of a general meridional water circulation in a circle through the Atlantic, Southern, Pacific, and Arctic oceans. The role of this circulation in the global heat exchange occurring in the world ocean is not clear, nor is the reason for this

Card 1/2

UDC: 551.465.553(269)

ACC NR: AT6035115

movement of ocean water. However, it is believed that Southern Ocean waters have no real effect on heat transfer and water circulation in the Atlantic, but they should be expected to affect Pacific Ocean water because of the Great Eastern Drift. Orig. art. has: 10 figures and 6 tables.

TITLE: Dynamic characteristics of an RPl controller 9

SOURCE: Priborostroyeniye, no. 11, 1964, 6-9

TOPIC TAGS: controller / RPl controller

ABSTRACT: The principle of operation as well as the characteristics of a contactless electric general-purpose RPl industrial controller are described; a functional diagram and a simplified connection diagram are given. A theoretical evaluation is presented of the effect of the relay characteristics, direct-channel inertia, magnetic and final amplifier inertia upon dynamic characteristics of the controller. These conclusions are offered: (1) The direct-channel inertia and trigger parameters result in a $k = f(A_{in})$ relation, where k is the controller gain and A_{in} is the amplitude of the input signal, which affects the stability of an

automatic-control system; (2) The magnetic and final amplifier, inertia, and also the brake hysteresis, increase the modulus and decrease the lead angle of the frequency characteristic, which again impairs the stability of the system. Orig. art. has: 5 figures and 9 formulas.

Mature maggots of the Cyclocoelum microstomum were extracted from air sacs of coots. Eggs were hatched in a Petri dish where they subsequently infected 20 mollusks (Lymnaea ovata). From one to 3 hours later incisions in mollusks revealed many miracidia around antennae, eyes

HELMINTHS

"On the Adaptation of Helminths, Parasitising in Tissues or in Isolated Organs of the Host, for Casting their Ova and Larvae out", by T.A. Ginetsinskaya, Vestnik Leningradskogo Universiteta, Seria Biologii, No 9, 1957, pp 53-57.

The helminths of tissues and isolated organs are adapted to cast their ova or larvae out, the author states. The ova of Schistosomatidae enter by means of breaking of the capillars of the host, the intestinal wall, and by contraction of the latter, into the intestinal lumen and are cast out together with the excrements. The tissue parasites may cause tumors which afterwards begin to fester. Helminths' ova or larvae come out of the ulcer. These larvae themselves can leave the host organism or may be withdrawn by blood-sucking insects.
